Waimee's Pizza Dough (3 Dough Balls) (1,816 kcal)

Final Dough		Baker's Formula		
Ingredient	**Final Dough Mix Quantity (g)**	**Quantity in Levain (g)**	**Total Recipe Quantity (g)**	**Baker's Percentage (%)**
Caputo '00'	440	0	440	88
All purpose flour	0	48	48	9.6
Whole wheat flour	0	12	12	2.4
Water	290	60	350	70
Fine sea salt	14	0	14	2.8
Levain*	120	NA	NA	12†

Note:

1) Feed your levain with 80 degree water and keep it at room temperature until it has increased in volume 75 to 100 percent from the build-up of gas (approx. 8 hours in a 72 degree kitchen). If the starter smells like over-ripe fruit, indicating a buildup of lactic acid, you will end up with a more buttery flavour. If the starter goes longer, it will begin to have a vinegary smell, indicating a buildup of acetic acid, and the final loaf will be more sour.
2) Mix the flour with 90 degree water in a tub and let the dough autolyse for about 30 minutes before incorporating the remaining ingredients using the pencer method (see https://www.youtube.com/watch?v=HoY7CPw0E1s for a demonstration). The target temperature of the dough at the end of the final mix is 77-78 degrees.
3) Bulk ferment the dough for about 6 hours in a 72 degree kitchen. It should increase in volume 50 to 75 percent from the build up of gas. It's important not to overferment the dough at this stage.
4) Build up the dough's gluten structure by performing four stretch-and-folds at 30 minute intervals during the bulk ferment's first two hours (see https://www.youtube.com/watch?v=CQHuWDEo3SA for a demonstration).
5) Create three equal size rounds, coat in olive oil, and put each in a container to proof in the refridgerator for 12-15 hours (see https://www.ikea.com/us/en/p/ikea-365-food-container-with-lid-round-glass-bamboo-s59567147/ for what I use).
6) About two hours before baking, remove the dough from the refrigerator to allow it to come to room temperature.
7) Heat your oven to 500 degrees with a pizza steel (see https://bakingsteel.com/collections/steels/products/baking-steel-original for my recommendation) about 8 inches below the broiler coil for an hour. A few minutes before loading your first pizza turn the broiler on high.
8) Dust your pizza peel with Semolina flour to prevent sticking.
9) Prepare your pizza with your desired toppings while the oven is heating (see https://youtu.be/TGwU87ndEzo?si=we7oLAvlVJYpIPA6 for stretching technique).
10) Set the oven back to 500 degrees and load a pizza and set a timer for 4 minutes. Switch the oven back to broil and observe until the pizza is finished, about 1-2 minutes.

* 1 part mature, active starter; 0 part caputo '00'; 1.6 part all purpose flour; 0.4 part whole wheat flour; 2 part water

† The baker's percentage for levain is the amount of flour in the levain expressed as a percentage of the total flour in the recipe.
